Definition of Phishing.

Phishing is a cyber social engineering attack where attackers trick people into revealing sensitive information like passwords, bank details or personal data, they pretend to be trusted sources instead of hacking humans they hack human trust, it works because it manipulates emotions not technology attackers rely on human behavior.

Types of phishing.

1. Email phishing: This is the most common type of phishing it consists fake emails pretending to be real that usually contain malicious links or attachments.

2. SMS phishing: This is a deliberate form of phishing a targeted attack and it is much harder to detect because usually it includes personal information on the victim like their name, age.. fake messages are sent on your phone

3. Whaling: this is a type of phishing used mainly for financial fraud and it is usually high profile individuals that are targeted

- Other types include, smishing,vishing,clone phishing.

Recognizing phishing common signs.

1. Urgent messages(act now).
2. Unknown or strange email addresses.
3. Suspicious links.
4. Spelling and grammar mistakes.

Staying safe from phishing.

1. Do not click unknown links
2. Always verify the sender
3. Use strong passwords
4. Enable two factor authentication
5. Never share personal information

Examples of phishing.

Painting a scenario where your bank account has been locked.

“Your bank account has been locked”…

Click here to verify
